## "Generation and propagation of Jovian quasi-periodic low frequency radio bursts"

Tomoki KIMURA

Co-workers:

H. Misawa<sup>a</sup>, P. Zarka<sup>b</sup>, B. Cecconi<sup>b</sup>, R. J. MacDowall<sup>c</sup>, R. A. Hess<sup>c</sup>, A. Morioka<sup>a</sup>, F. Tsuchiya<sup>a</sup>, and Y. Kasaba<sup>a</sup>

a: Tohoku University (Japan)

b: l'Observatoire de Paris (France)

c: Goddard Space Flight Center (USA)

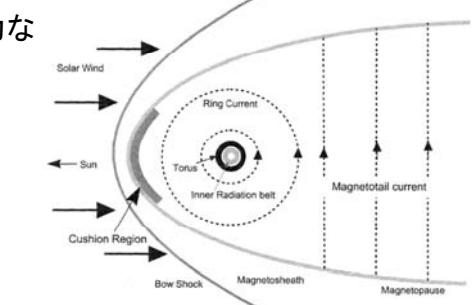

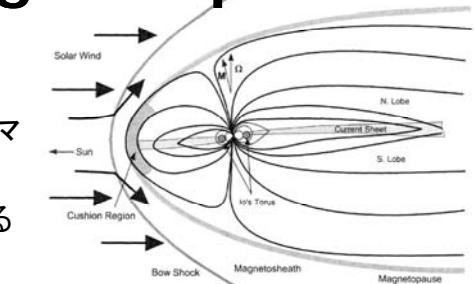

Fig . A schematic of Jovian magnetosphere (Khurana et al., 2004)

2010/6/30

## Jovian radio emissions

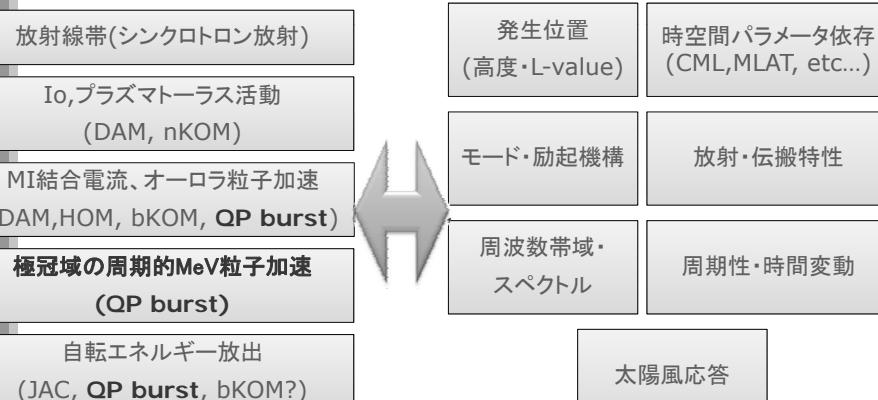

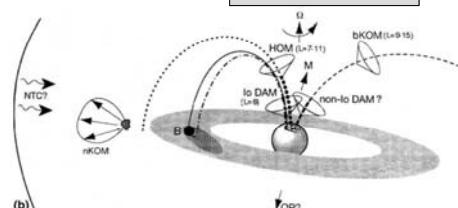

Fig . A schematic of Jovian radio emissions (Zarka, 2004)

2010/6/30

3

## Jovian magnetosphere

- ① 強力な磁場
- ② 高速自転
- ③ 衛星イオ起源重いプラズマ

- 自転エネルギーが支配する「自転駆動磁気圏」
- ⇒ 地球:「太陽風駆動磁気圏」
- 太陽系惑星中で、最も強力な粒子加速過程が存在。

Fig . A schematic of Jovian magnetosphere (Khurana et al., 2004)

2010/6/30

## Quasi-Periodic bursts

□ Quasi-Periodic burst:  
VLF radio bursts with  
quasi-periodicity  
(a few-tens min.)

□ Relativistic particle  
bursts: electron/proton  
outbursts accompanied  
by QP bursts with 40-  
min period  
(McKibben et al., 1993; Zhang et  
al., 1995)

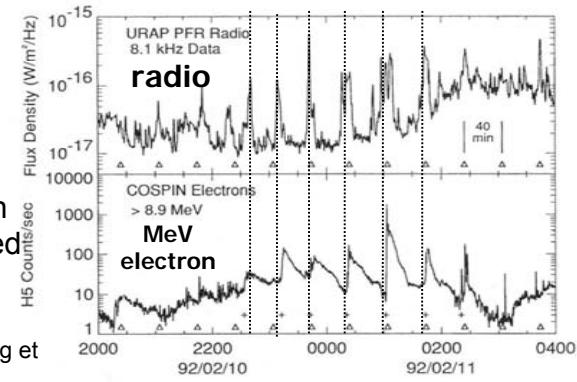

Fig . QP radio bursts with 40 min periodicity  
accompanied with relativistic electron outbursts  
(MacDowall et al., 1993).

6/30/2010

4

# Periodic aurorae

- X-ray "hot spot" in the polar cap region pulsating with 45 min period (Gladstone et al., 2002)
- Particle penetrations to the stratosphere in the hot spot ? (Flasar et al., 2004)
- Polar UV aurora positively correlated with VLF waves (Pryor et al., 2005)

Chandra Jupiter X-rays – December 18, 2000

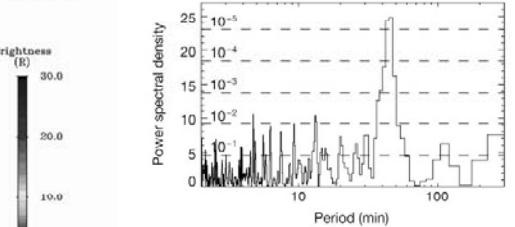

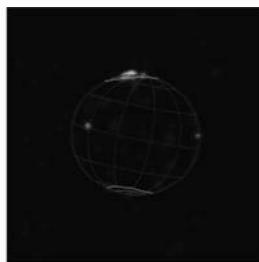

Fig. X-ray "hot spot" with  $\sim$ 45 min periodicity observed by CXO (Gladstone et al., 2002).

What process drives the quasi-periodic radio and auroral emissions ?

# Problems

- Relativistic & periodic particle accelerations
  - Driver, cause of quasi-periodicity, corresponding magnetospheric dynamics...
- Description of QP bursts
  - Source location, propagation process, generation...

## Purpose of this thesis

- Elucidation of QPBs' generation and propagation

- Restrictions on particle accelerations
- Elucidation of strong & periodic particle accel.
- Probe magnetospheres and particle accel. by planetary radio emissions...

6/30/2010

6

## Approach

### Observation

- Occurrence dependence
- Periodicity
- Polarization and source directions

### Interpretation

- Interpretation of observations based on ray tracing
- → Source location, directivity, wave modes, etc.
- → Restrictions on generation mechanisms

### Generation mechanisms

- Theoretical validation of wave generation mechanisms
- Validation of particle acceleration scenario based on in-situ observations

6/30/2010

7

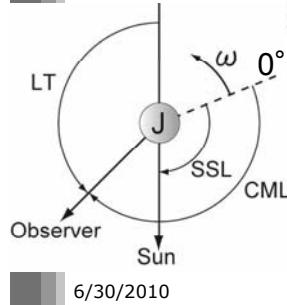

## 3. OCCURRENCE CHARACTERISTICS

6/30/2010

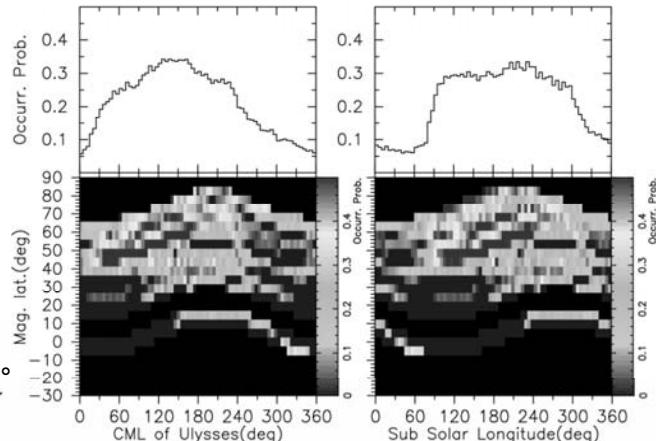

8

## QPB at high lat-Ulysses

Fig . Statistical distribution of QP bursts observed at high latitudes (Kimura et al., 2008b)

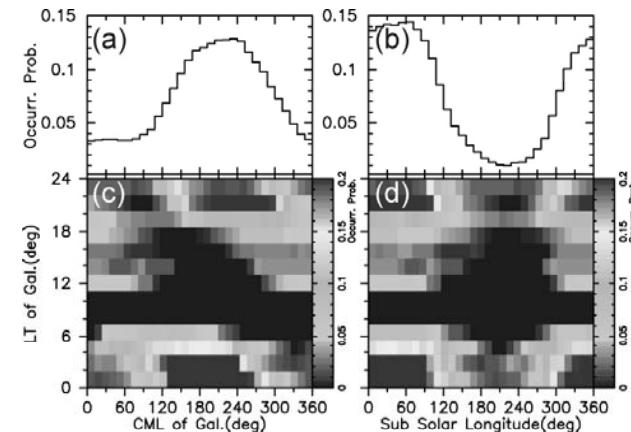

6/30/2010

QPBs observed at high lat.:  
dependent on longitudes  
they are observed at MLAT>30°

## QPBs at low lat.-Galileo

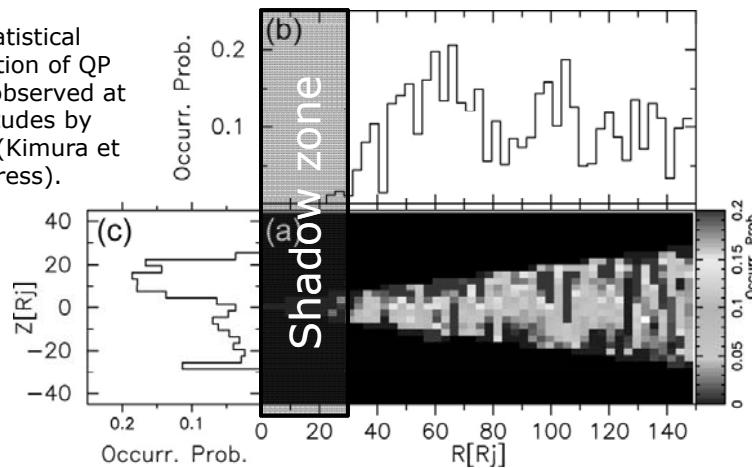

Fig . Statistical distribution of QP bursts observed at low latitudes (Kimura et al., in press)

QPBs observed at low latitudes:  
dependent on longitudes.  
similar rotational phase dependence in almost all local times.

## Meridional distribution-Galileo

Fig . Statistical distribution of QP bursts observed at low latitudes by Galileo (Kimura et al., in press).

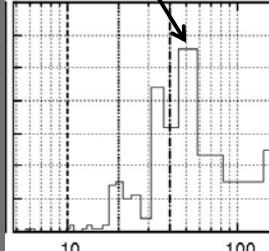

QPBs at low lat.:  
shadow zone in a region of  $|MLAT| < 10^\circ$ ,  $R < 30R_j$

6/30/2010

11

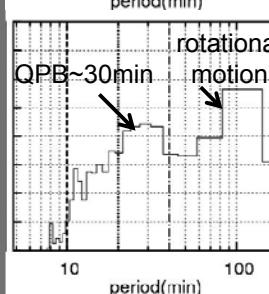

## Periodicity of QP bursts

QPB~50min  
10min ----- Lomb periodogram : spectral data with false alarm probabilities less than 0.5  
20min -----  
40min -----

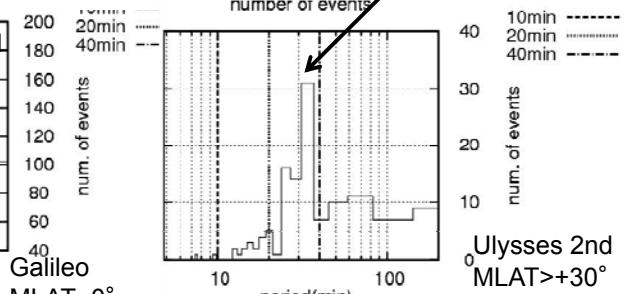

"~40min" periods are dominant at all geometries

Fig .Distributions of periodicities with high occurrence probabilities.

QPB~30min  
rotational motion

Ulysses 1st  
MLAT~40°

Ulysses 2nd  
MLAT>+30°

QPB~35min

## 4. POLARIZATION PROPERTIES

6/30/2010

13

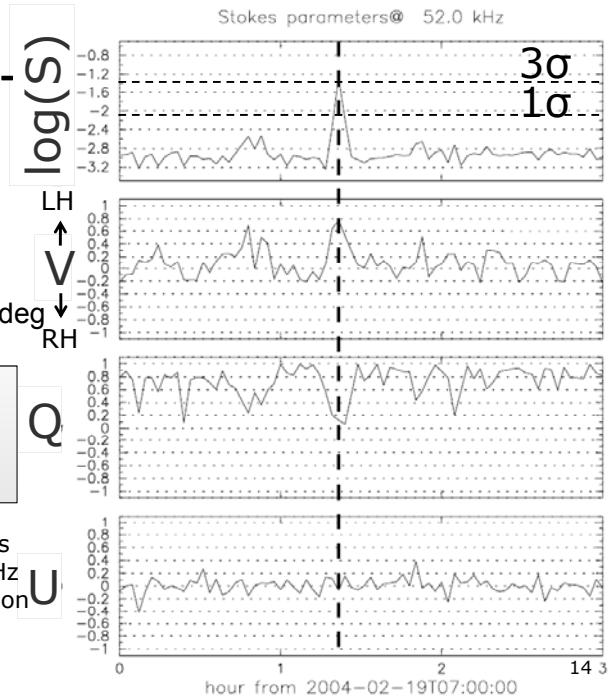

### Stokes parameters-Ulysses

- Ulysses
  - R: ~0.8AU
  - LAT: 41deg
  - LT: 17.1hr
  - CML: 193-301deg

- $V \sim +0.8$
- $Q \sim U \sim 0.0$
- $\Rightarrow$  LH circular

Fig . A plot of Stokes parameters at 52 kHz from 7:00 to 10:00 on Feb 19, 2004.

6/30/2010

### Statistics-Cassini

- criteria: pulse groups with intensities 20db larger than backgrounds at <30kHz
- assumption: source is located at the center of Jup.
- num. of events: 44

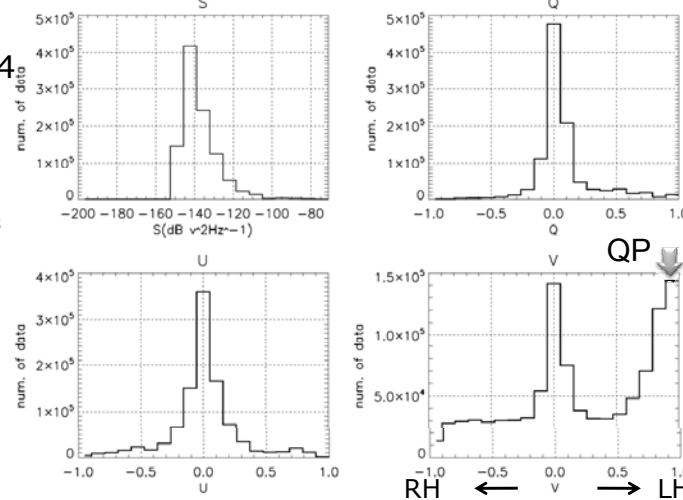

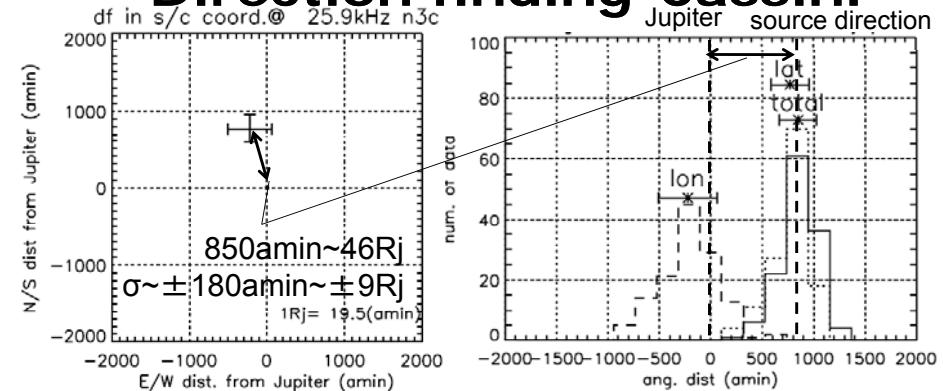

Fig . Histograms of QP bursts' Stokes parameters during the present analysis period.

6/30/2010

### Direction finding-Cassini

- apparent altitudes  $\sim 850 \text{ amin} \sim 46 \text{ Rj} (\pm 9 \text{ Rj})$
- source of L-O mode:  $f_p = 20 \text{ kHz}$  surface  $\sim 2 \text{ Rj}$
- source of R-X mode:  $f_{RX} \sim f_c = 20 \text{ kHz}$  surface  $\sim 10 \text{ Rj}$

Fig . The direction and angular distribution of QP bursts measured by Cassini on Dec 22, 2000.

- ① refraction/scattering by sheath
- ② real source region at sheath

\*error estimation:  
 $\sigma < \pm 220 \text{ amin} \sim \pm 11 \text{ Rj}$   
 $\text{offset} < 290 \text{ amin} \sim 15 \text{ Rj}$   
 for point source

## 5. INTERPRETATION OF OBSERVATIONAL RESULTS BASED ON PROPAGATION ANALYSIS

6/30/2010

17

### QPBs observed at low lat.

- ❑ mode:RX(LO) mode
- ❑  $f \sim f_{RX} \sim f_c$  surface  $\sim 10R_j$
- ❑ filled cone like radiation

→ "shadow zone"

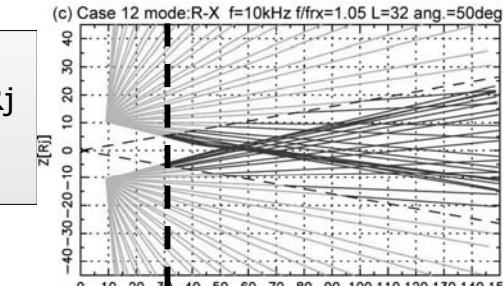

Fig . (top) Distribution of modeled ray paths and (bottom) the observed meridional distribution of QP bursts (Kimura et al., in press).

6/30/2010

## High Latitudinal Results-Ulysses

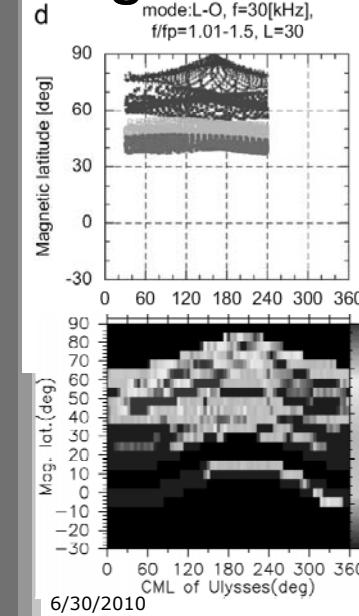

Fig . (top)  
Distribution of modeled ray paths and (bottom) the observed distribution of QP bursts (Kimura et al., 2008b).

- ❑ mode: LO mode
  - ❑  $f \sim f_p$  surface  $\sim 2R_j$
  - ❑ filled cone like radiation
  - ❑ excited at particular rotational phase
- observed structures in lon&lat

18

### Brief Summary-Interpretation of Observations

	altitude	L-value	region	mode	direct.
High lat.	$f \sim f_p \sim 2R_j$	$30 <$	pol. low alt.	LO	filled
Low lat. (in MS)	$f \sim f_c \sim 10R_j$	$20 <$	pol. high alt.	RX (LO)	filled

- ❑ See Kimura et al. (2008b); Kimura et al. (2010) for more details.

6/30/2010

20

## 6.1. MICROSCOPIC GENERATION MECHANISM OF QUASI-PERIODIC BURSTS

6/30/2010

21

### Linear Growth Rate

- Linear wave growth rate by cyclotron resonance  
(e.g., Baldwin et al., 1969; Lee et al., 1979; Nishimura et al., 2007)

$$\omega_i = \omega_r \sum_s \frac{2\pi\omega_{ps}^2}{G\omega^2 n_s} \int d\mathbf{u} \sum_{n=0}^{\infty} \frac{u_{\perp} n \Omega_e}{\gamma k_{\perp}} (\alpha_1 J_n^2 + \alpha_2 J_n J_{n+1} + \alpha_3 J_{n+1}^2).$$

- $\omega_i$ : linear growth rate
- $\omega_r$ : real part of frequency
- $\omega_{ps}$ : plasma frequency of s-th component
- $n_s$ : number density of s-th component
- $u = yv$  (specific momentum)
- $\Omega_e$ : cyclotron frequency
- $k$ : wave number
- $n$ : order of resonance
- $J_n$ : n-th order Bessel function
- $G = G(u, k, \omega, n, \Omega_e, \omega_p)$
- $\alpha_i = \alpha_i(u, k, \omega, n, \Omega_e, \omega_p)$

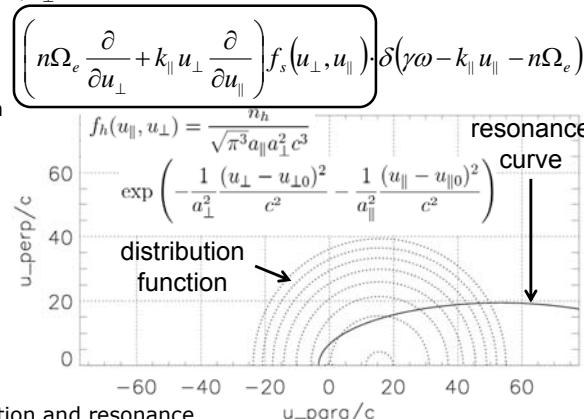

Fig. Distribution function and resonance curve in the momentum space.

23

## Characteristics of electron bursts

- McKibben et al. (1993) & Zhang et al.(1995): observations by Ulysses/COSPIN
  - Particle flux:  $\sim 315/\text{cm}^2/\text{sec}$  ( $> 16\text{MeV}$ ,  $R \sim 54\text{R}_J$ )

	$R \sim 10\text{R}_J, > 16\text{MeV}$	$R \sim 2\text{R}_J, > 16\text{MeV}$
Particle flux	$\sim 9.5 \times 10^4/\text{cm}^2/\text{sec}$	$\sim 9.5 \times 10^6/\text{cm}^2/\text{sec}$
Number density	$\sim 3.2 \times 10^{-6}/\text{cc}$	$\sim 3.2 \times 10^{-4}/\text{cc}$
BG density	$\sim 1.1 \times 10^{-5}/\text{cc}$ (model)	$\sim 120/\text{cc}$ (model)
$n_{\text{beam}}/n_{\text{BG}}$	$\sim 3.2 \times 10^{-1}$	$\sim 2.6 \times 10^{-6}$

- duration:  $\sim 120\text{sec}$
- outbursts from Jovian polar region
- Energy flux:  $\sim 2.9 \times 10^{12}\text{W}$  (QPB  $\sim 10^8\text{W}$ )

12:31:52 – 12:37:40, Day 41

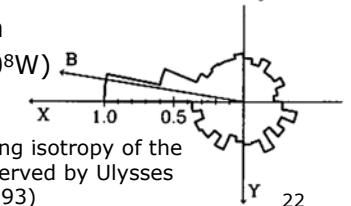

Fig. A plot showing isotropy of the proton burst observed by Ulysses (Zhang et al., 1993)

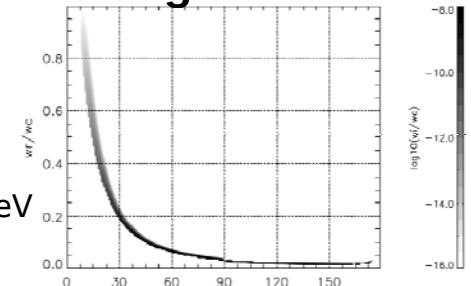

6/30/2010

22

### O mode waves - ring beam

#### Condition

- mode: O
- $\omega_p/\omega_c = 0.001$
- $\omega_c = 30\text{kHz}$
- $u_{x0} \sim 15\text{MeV}$ ,  $u_{y0} \sim 4\text{MeV}$
- $A_{||} = A_{\perp} \sim 300\text{keV}$
- $n = 1$

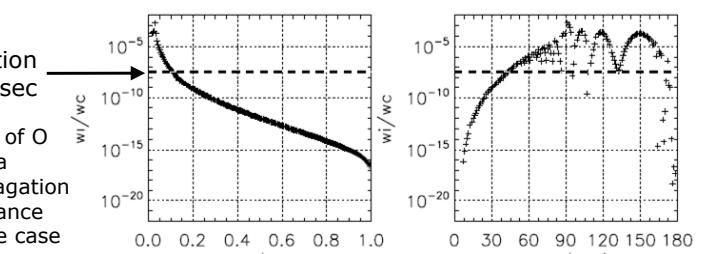

outburst duration  $\sim 120\text{sec}$

Fig. Growth rate of O mode waves as a function of propagation angle and resonance frequency for the case of polar high source altitudes.

6/30/2010

23

Ring beam: LO mode waves with broad beaming and significantly high growth rates

24

## X mode waves - ring beam

### Condition

- mode: X
- $\omega_p/\omega_c = 0.001$
- $\omega_c = 30\text{kHz}$
- $u_{x0} \sim 15\text{MeV}, u_{y0} \sim 4\text{MeV}$
- $A_{||} = A_{\perp} \sim 300\text{keV}$
- $n = 1$

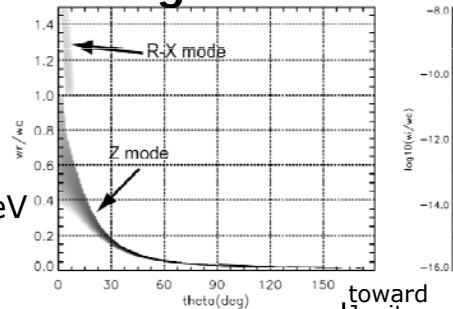

Fig. Growth rate of X mode waves as a function of propagation angle and resonance frequency for the case of polar high source altitudes.

Ring beams cannot generate RX (free-space) mode wave consistent with observations. Z mode waves are locally generated.

## Discussion and Summary

### Direct generation: possible

#### Free-space waves are generated at possible source region of QPBs.

- Dist. func.: unstable structure is required (e.g., ring beam).
- Directivity: broad beaming, being consistent with obs. & rtc (Kimura et al., 2008b, 2010)
- Wave mode: LO mode => possible,  
RX mode => impossible

#### Z mode waves are locally generated.

- A good candidate for energy sources of the mode conversion process (e.g., Oya, 1974).

6/30/2010

26

## 6.2. MACROSCOPIC GENERATION PROCESS OF QUASI-PERIODIC PHENOMENA

6/30/2010

27

## Flux Transfer Event Scenario

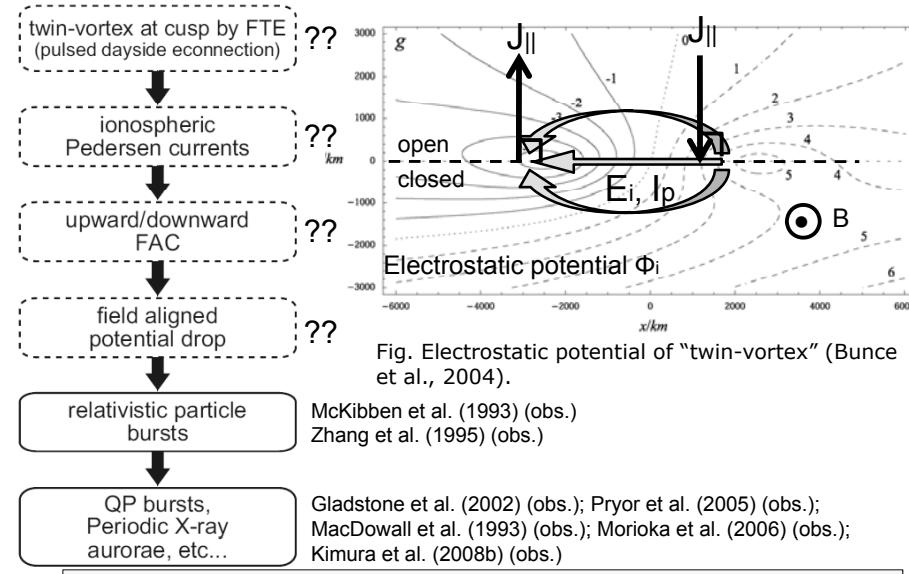

Fig. Electrostatic potential of "twin-vortex" (Bunce et al., 2004).

McKibben et al. (1993) (obs.)  
Zhang et al. (1995) (obs.)

Gladstone et al. (2002) (obs.); Pryor et al. (2005) (obs.);  
MacDowall et al. (1993) (obs.); Morioka et al. (2006) (obs.);  
Kimura et al. (2008b) (obs.)

FTE scenario (Bunce et al., 2004): strong parallel accel. at cusp

## Validation: Cross Correlation

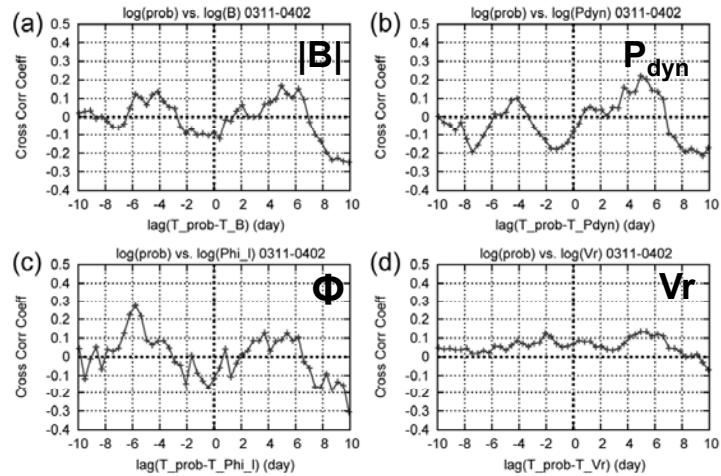

Fig. Cross correlation coefficients as functions of lag time between QP bursts' occurrence and solar wind parameters.

$P_{dyn}$ : dynamic pressure,  $|B|$ : magnitude of IMF  
 $\Phi$ : reconnection voltage,  $V_r$ : radial velocity of SW

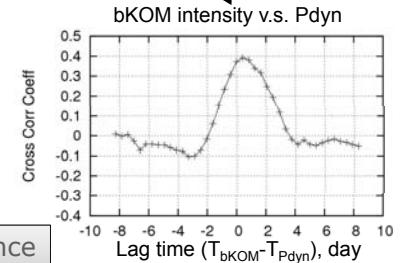

29

## Comparison with other radio components

	nKOM	HOM	bKOM	QPB
Related to	inner MS	middle MS	open-closed boundary	outer MS (cusp?)
IMF $ B $	○	○	○	✗
$P_{dyn}$	✗	○	○	✗
reconnection voltage	✗	△	○	✗
Time lag	10h>	10h>	10h-1day	N/A

○: positively-correlated (one peak of  $r \geq 0.3$  within  $\pm 5$  days lag)  
✗: uncorrelated

FTE scenario: no supportive evidence

## Field Line Resonance Scenario

31

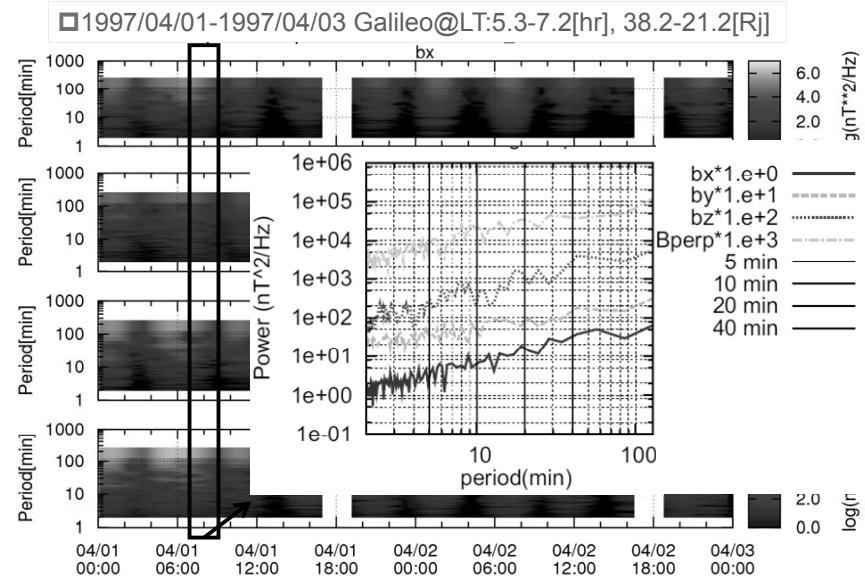

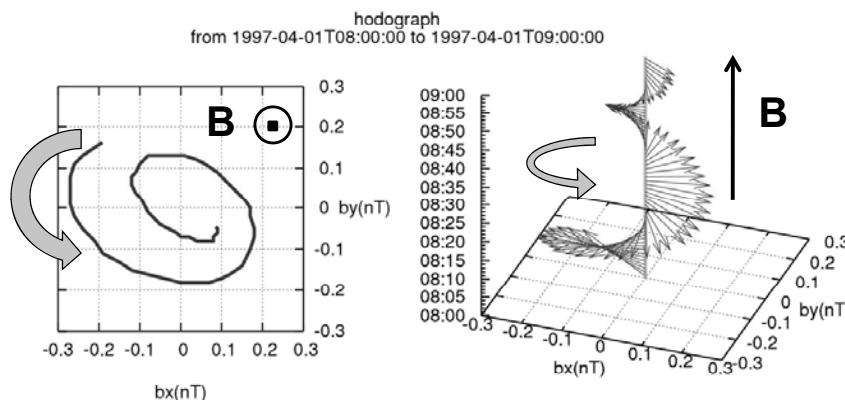

Fig . A dynamic spectrum of the perturbation field.

perturbation fields in the mid. MS with a few-tens min. periods

## Hodograph of perturbation field

- ◻ Perturbation fields above/below current sheet  
→Alfvenic circular variations with small amplitudes
- ◻ propagation angle~tens deg

- Radial distance~30Rj
- ~6Rj from Mag. Eq.
- prop. ang.:~25° (or 25° +180° )
- amplitude/BG~1%

Fig . Hodograph of the perturbation field in a plane perpendicular to background field

33

## Polar Alfvénic perturbation

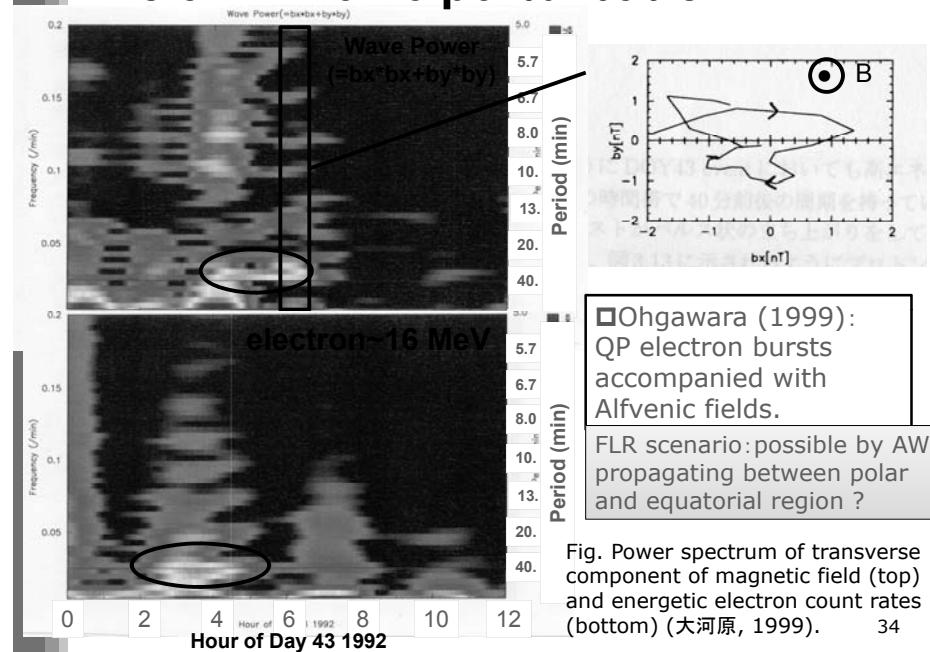

Fig. Power spectrum of transverse component of magnetic field (top) and energetic electron count rates (bottom) (大河原, 1999). 34

## Picture of QP phenomena

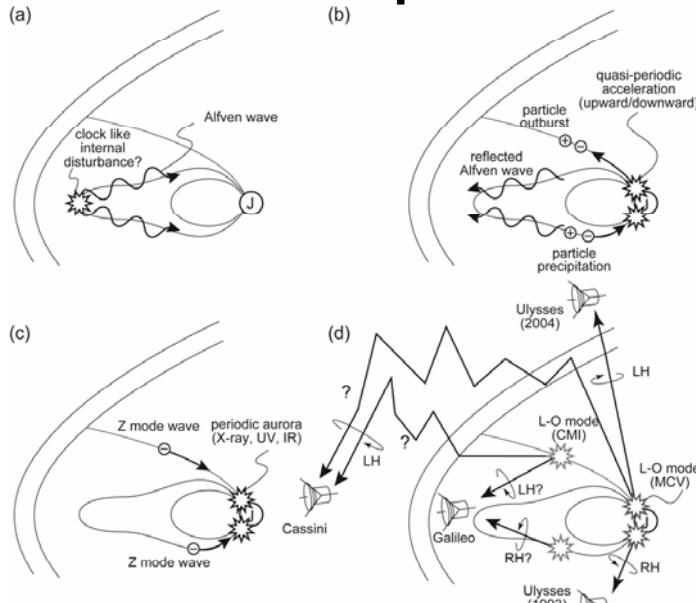

Fig A picture of Jovian quasi-periodic phenomena proposed by this thesis.

35

## Summary & Conclusions

- ◻ Observational characteristics of QPBs
  - Occurrence :rotational phase, "shadow zone", "40min" period
  - Polarization:LH@high lat, LH@low lat outside MS
- ◻ Interpretation of obs. by ray tracing. Two kinds of source region
  - polar low altitudes:LO mode, propagating to high lat.
  - polar high altitudes:RX mode, propagating to low lat.
- ◻ Generation mechanisms:
  - direct generation: LO mode generated directly at low and high altitudes
  - unstable structures (e.g., ring beam) are required
  - indirect generation:Z mode at high and low alt.→propagate to low alt.→converted to LO mode
- ◻ periodic particle accel. :internal process is more plausible than external process.

36

# Plans at ISAS

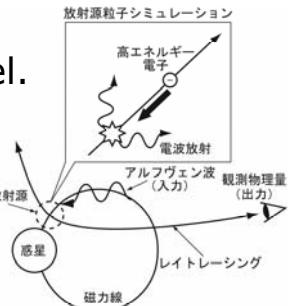

- particle simulation

- demonstration of DAW accel.  
accompanied with QPBs

- including electron kinetics  
(for w-p interaction)

- PIC code

- details: TBD

- Particle sim.+Ray tracing

- =>numerical model for generation  
and propagation of PRE
